Right pane: To enable ADC interface capability you must have FASAPI.DLL loaded. FASAPI.DLL is loaded during FCC 1027SP1 install. If file is missing reload FCC 1027SP1 local only.

Status bar: Objects (Disk free space: 96.7 GB) 2.92 MB My Computer

# How ADC interface works with FAS

1. ADC Export.DLL calls up Varec FASAPI.DLL.
2. FASAPI.DLL extracts billing information from downloaded ADC transactions. (i.e. card number, tail number, date, times, unadj gallons, adj gallons, iss pt and iss pt num).
3. A proper transfer has taken place when ADC transactions move from current table to export table.
4. ADC transaction populates logsheet and provides necessary billing information.
5. If ADC transaction does not match entry in log sheet, the transaction moves to ADC Hold table. (matching criteria – Tail Number, Date, Issue Pt and Issue Pt Number)
6. A successful population ADC transaction with logsheet is indicated by “Stop Fuel” in status column.

## SYSTEM CONFIGURATION

- First things first- Ensure your system configuration has the “Real-time Auto Export Transaction to FAS” box checked.
- This feature enables transaction to be exported automatically to FAS without any further action by the user.

ODDLOG

## Dispatch Equipment to A/C

- Log in the A/C Tail Number as normal.
- Dispatch Equipment and Operator to A/C location as normal.
- Once the refueling equipment operator arrives at the location, he/she will call in a 10-97 as normal.
- The Resource Controller will log in the 10-97 as normal.

# OPERATOR'S RESPONSIBILITIES

- The operator needs to verify the MSC card (example below) for the correct Tail Number, Branch of Service, and Expiration date.
- Once the information is verified, the operator will swipe the card in the Unit Interface Terminal (UIT).
- The operator will then select the type of refueling operation that applies.

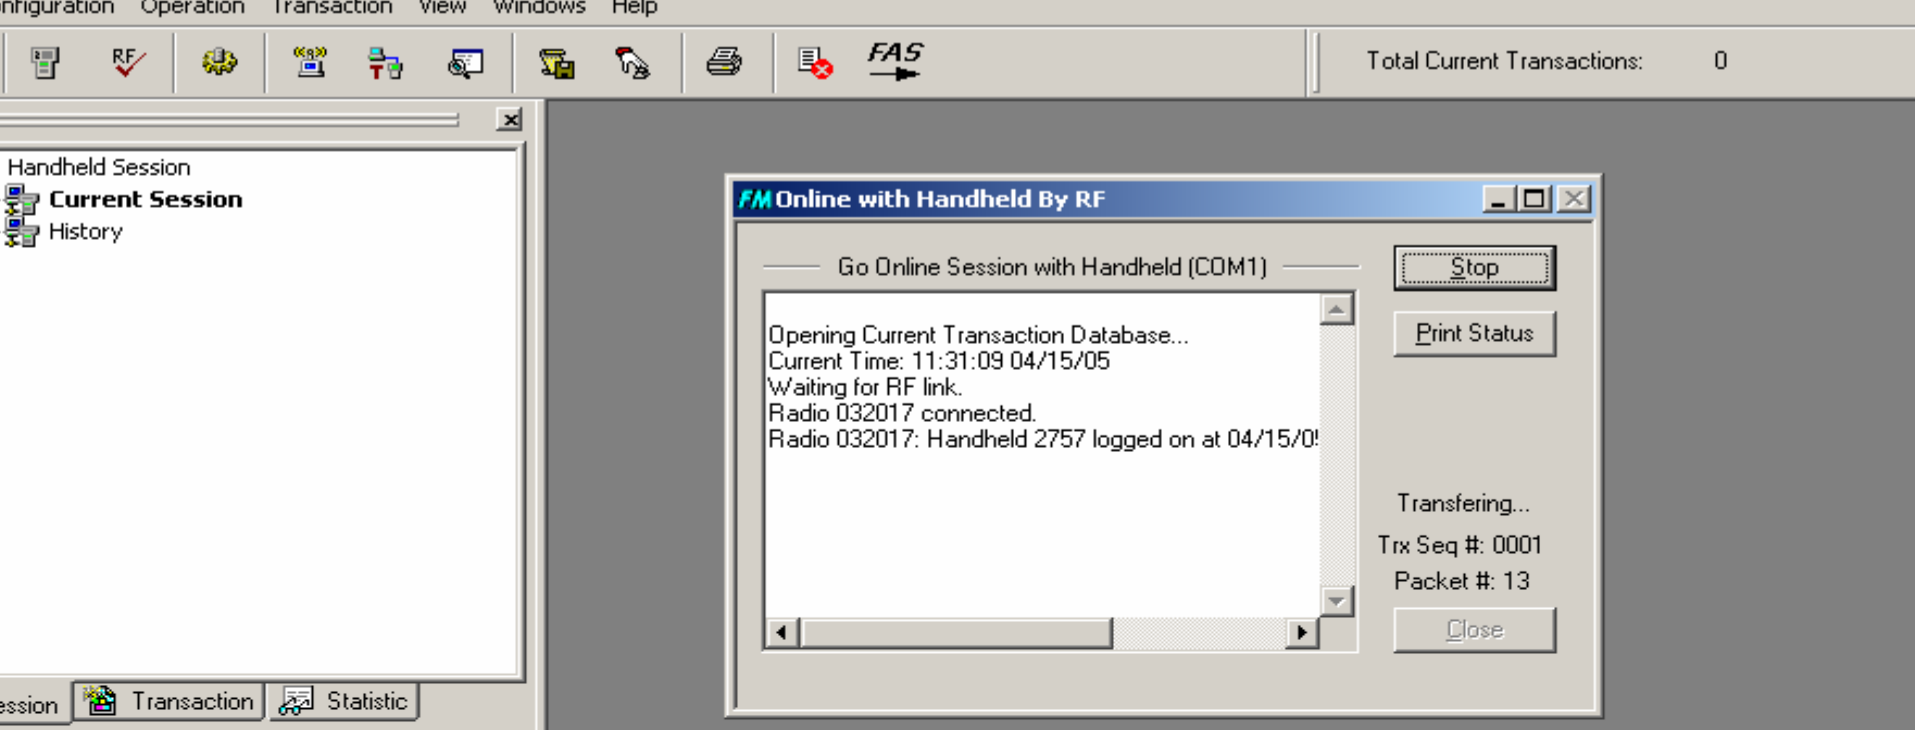

## OPERATOR'S RESPONSIBILITIES (CONT)

- The operator may then begin the refuel/defuel operation.
- Once the operation is complete the operator will press the “CLEAR/NO” button on the ADC to stop the transaction.
- The operator may then print out the applicable number of paper copy receipts from the UIT.
- The UIT will then go into RF Download mode and begin to send the transaction back to the RCC computer.

## ONLINE SESSION WITH THE HANDHELD

- The Resource Controller will go online with the handheld to retrieve the transaction via RF.
- The online session window will display what handheld unit is logged on.
- Once the transaction has been sent successfully, the handheld unit will log off of the PC.
- The transaction will automatically export to FAS and will show up under the “Exported Transaction” screen.

## EXPORTED TRANSACTION SCREEN

- This screen is where the exported transaction will appear
- This is indication that the transaction has successfully been exported to the logsheet

Status	REQ	RCVD	OPERATOR	MDS	TY	TNO	GRAL	LOCATI	REF	DISP	ARR	DEP	RESPOI	GAL	GROSS G	VAR	DATE	MEMO
STOP FUEL	RIZO	11:16	GREER	F016	A	78000057	JP8	A-1	98	11:16	11:25		10	588	593	0	04/15/2005	

## IMPORTED TRANSACTION

- Once the transaction has been imported into the log sheet, it will either:
  - Populate the line number with the transaction information
  - Go directly into the ADC hold table
- The transaction will go to the hold table if the following information does not match the log sheet:
  - Issue point
  - Issue point number
  - A/C Tail number
  - Date

## HOLD TABLE EXAMPLE

- The green light next to the ADC button will light up when there is a transaction sitting in the hold table
- The transaction was exported from ADC and imported into FAS but, at least one of the mandatory parameters did not match

# HOLD TABLE

- If the light is green, click on the ADC button to open the hold table
- Any transactions that have been exported from ADC but, have not populated the log sheet will show in the table
- Open the transaction by double-clicking on the line
- Check the transaction to make sure all of your mandatory parameters match the original dispatch
- ADC Hold indicator = **Green 5 or less**, **Yellow 10 or less** and **Red 10 or more** transactions.

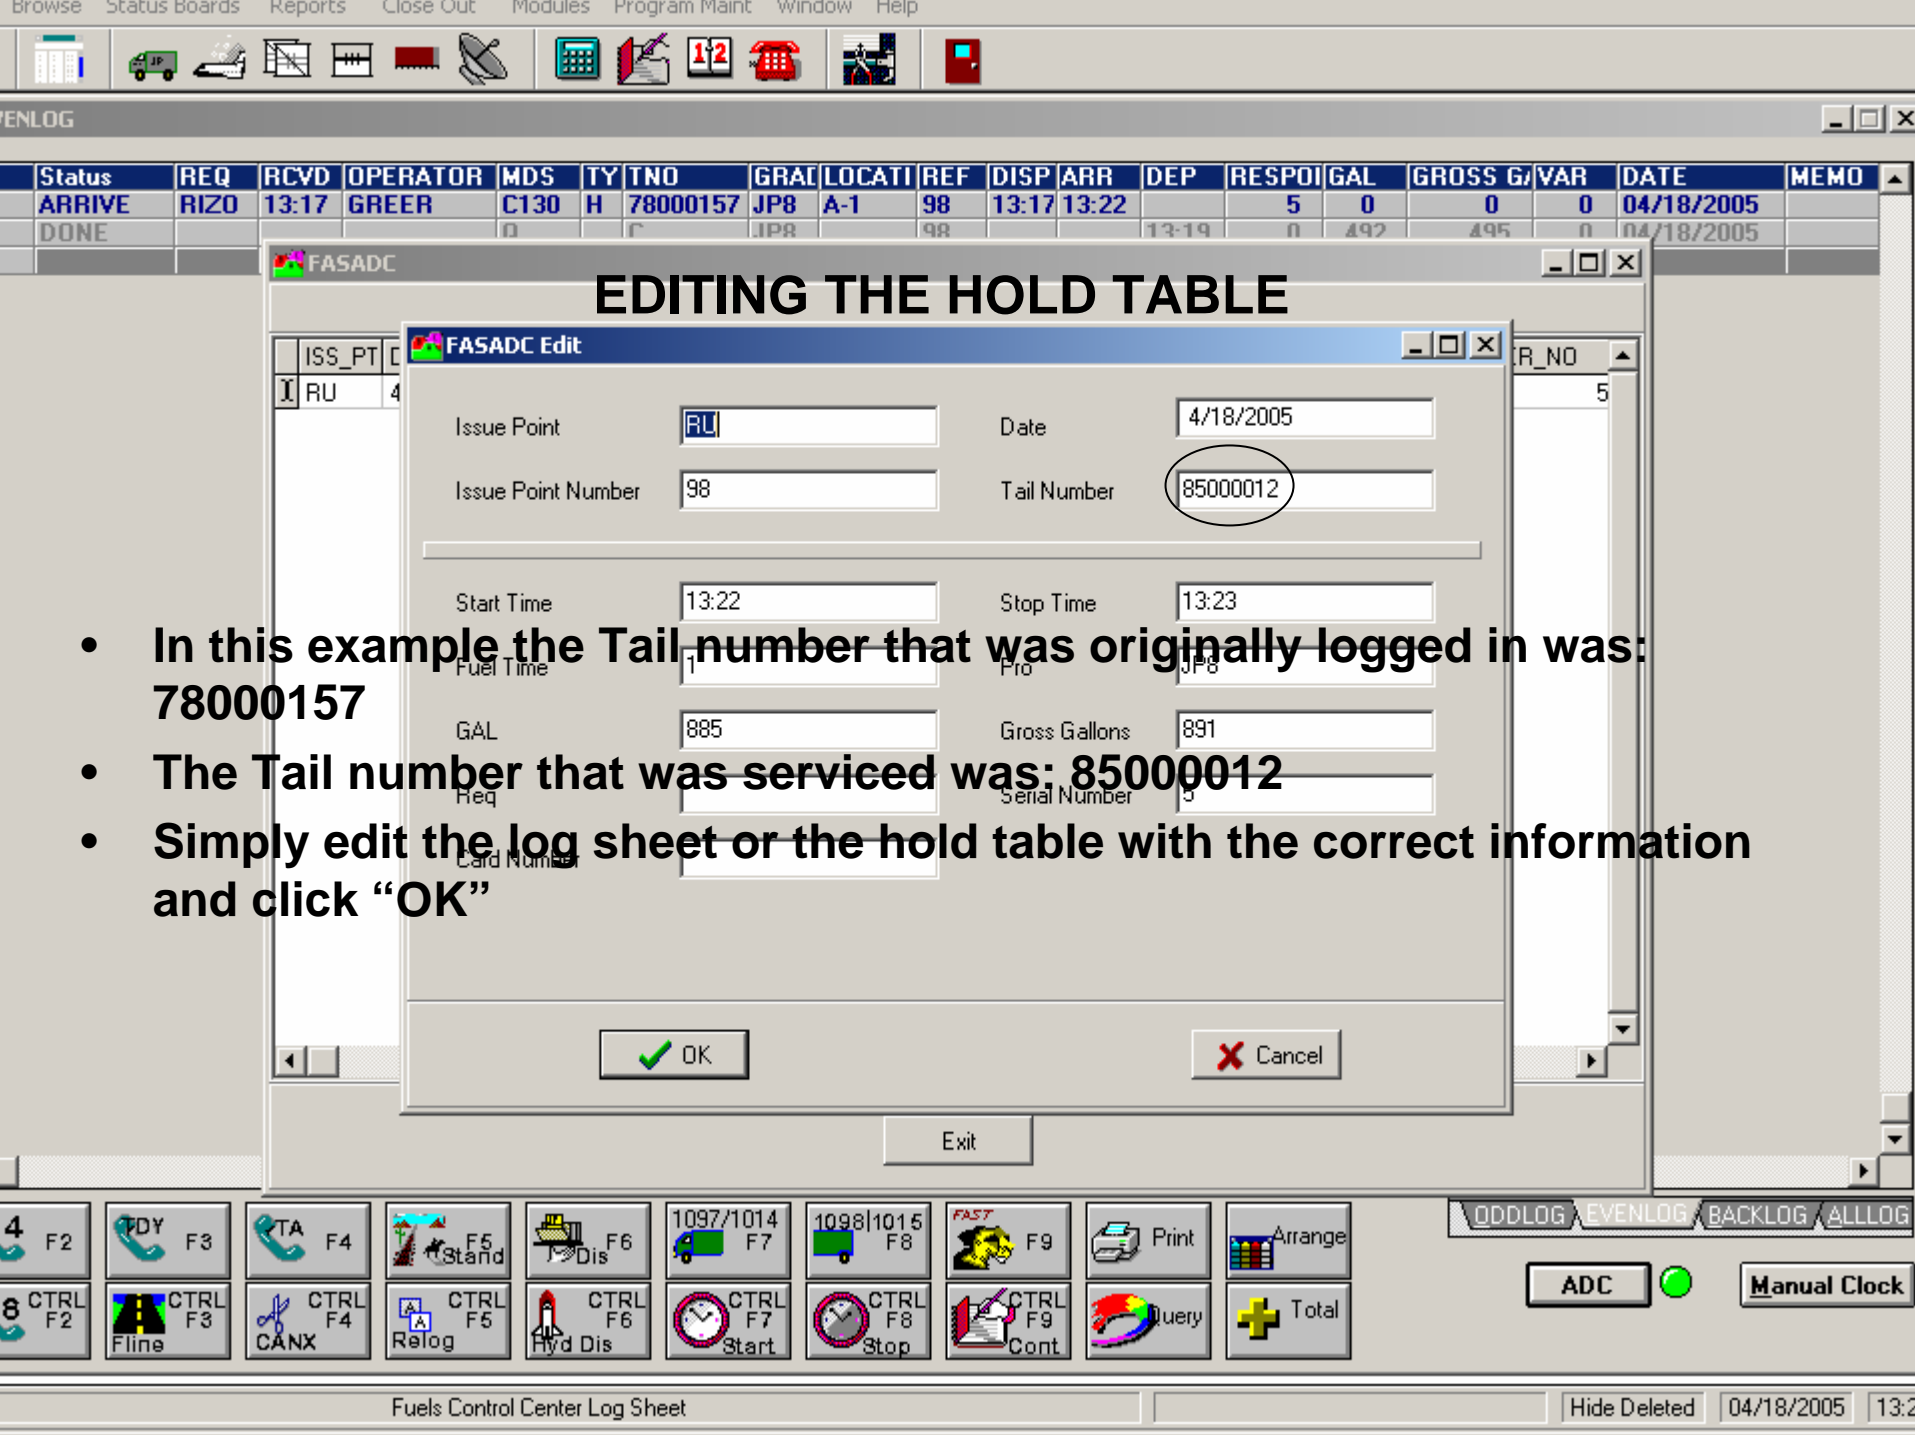

Exit

## EDITING THE HOLD TABLE

- In this example the Tail number that was originally logged in was: 78000157
- The Tail number that was serviced was: 85000012
- Simply edit the log sheet or the hold table with the correct information and click “OK”

Status	REQ	RCVD	OPERATOR	MDS	TY	TNO	GRAL	LOCATI	REF	DISP	ARR	DEP	RESPOI	GAL	GROSS G	VAR	DATE	MEMO
DONE	RIZO	13:17	GREER	C130	H	78000157	JP8	A-1	98	13:17	13:22	13:28	5	885	891	0	04/18/2005	
DONE				Q		C	JP8		98			13:19	0	492	495	0	04/18/2005	
DONE				R		M	JP8		98			13:20	0	530	534	0	04/18/2005	
STOP FUEL	FCC		GREER	F		S	JP8		98	13:28	13:28		0	3402	3424	0	04/18/2005	

## CLEARING THE HOLD TABLE

- Once the information has been edited to match, the transaction will clear the hold table and populate the dispatch line
- The status will change from “ARRIVED” TO “STOP FUEL”
- The Resource Controller will then log in a 10-98 for that unit to change the status to “DONE”
- The Resource Controller may then dispatch the unit to another location, 10-13 the unit or 10-10 the unit as normal

## DISPATCH TO THE FILLSTAND

- The Resource Controller will dispatch the unit to the fillstand as normal
- The operator will select the option to fill the unit on the UIT
- The fill will populate the log sheet once the operation is complete

Recirculation for Quality Control (Lab)

Recirculation for Maintenance

# Logsheet view of Recirculations

## **EXAMPLES OF FILL AND RECIRCULATION**

- **The line for the fill will gray and a status of “STOP FUEL” will be shown**
- **The Resource Controller will then log in a 10-15 for the unit to get a status of “DONE”**
- **The Resource Controller may then dispatch the unit to another location or 10-10 the unit as normal**
- **Recirculation for Maintenance or QC is accomplished by the Maintenance or Lab personnel, using the UIT**
- **The Resource Controller will not log anything in the log sheet**
- **The recirculation will populate the log sheet automatically once the operation is complete**
- **Once the operation is complete the Resource Controller will input the operator’s name**

Status	REQ	RCVD	OPERATOR	MDS	TY	TNO	GRAL	LOCATI	REF	DISP	ARR	DEP	RESPON	GAL	GROSS G	VAR	DATE	MEMO
DONE	RIZO	11:16	GREER	F016	A	78000057	JP8	A-1	98	11:16	11:25	11:40	10	588	593	0	04/15/2005	

## SUMMARY

- The Resource Controller will dispatch the run as normal
- The operator will use ADC and perform applicable refueling operation
- The Resource Controller will go on-line with the handheld to receive the transaction data via RF
- The transaction will be exported from ADC and imported into FAS
- The transaction data will either populate the log sheet or be stored in the hold table
- If the transaction goes to the hold table, the Resource Controller will correct the information to ensure the four required parameters match
  - Issue point
  - Issue point number
  - Tail number
  - Date

Once the information is correct the Resource Controller may then dispatch the unit as necessary
